

Methodology for Evaluating Pesticides for Surface Water Protection

Sheryl Gill
Yuzhou Luo

Objective

Develop a more consistent, transparent, and faster method for evaluating new Al registration packages

History

- Approx 10 new active ingredient registration packets per year.
- All new active ingredient products labeled for use outdoors in agricultural or urban settings, except:

Microbial and Biochemical pesticides, Pheromones, Bactericides, Antimicrobials, Vertebrate pest control products (repellents, rodenticides, etc.), Plant growth regulators, Products intended for use in bee hives, Insect repellants or attractants, Products intended for use on stored foods (fruit, grain, nuts, etc.), Products intended for use with a bait station or trap

History

- No "official" process, system, or model.
- Professional judgment and experience from past assessment of the conditions and mechanisms responsible for offsite transport to surface water.

Physical/chem props, Use patterns, Compare to known contaminants

Toxicological impact on aquatic life.

Problems

- Somewhat inconsistent, not transparent
- What is a "typical" surface water contaminant?
- Toxicity endpoint?
- Lengthy process

Conditional Registration

- Process for Al's in the gray area.
- What additional data to ask for and how useful is it?
 - Toxicity tests
 - Edge-of-field monitoring
 - Ambient SW monitoring
 - Analytical method

Solution

- Systematic model less arbitrary
- Method to flag Als of concern
 - -Monitoring
 - -Review of new products
- More transparent for registrants
 - -Easier to predict what Als might be a concern for SW
 - -Easier to predict what additional data we might ask for.

The Method

General procedure

 A more consistent and transparent method for evaluating registration packages

Registrantsubmitted data

Evaluation method

Registration recommendations

A watch-list of A.I.'s for further actions

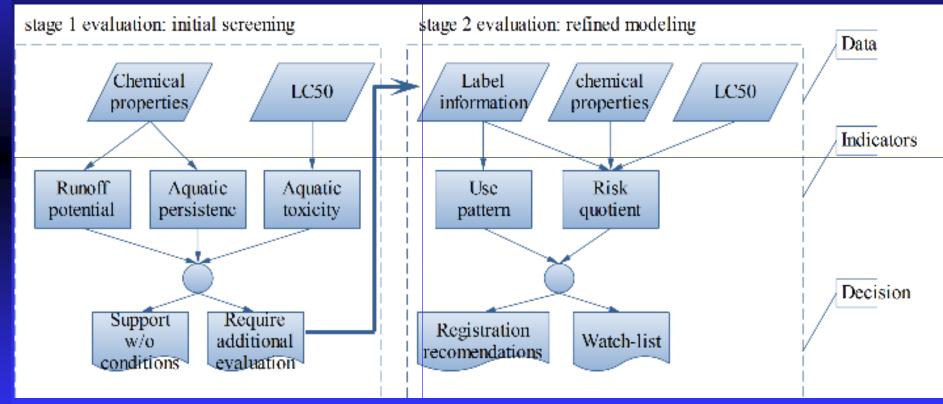

Development

Procedure	Inputs/Methods	Results
Selecting input data	Registrant-submitted data	Chemical properties, toxicity data, label
Developing indicators	 Well-accepted criteria & models Development & improvement 	5 descriptive indicators, as "high" (H), it "intermediate" (M), and "low" (L) classes
Making decisions	Integrate indicators for appropriate decisions	Registration recommendationsA watch-list

Two-stage procedure

Indicators

Indicators	Input parameters	Approaches
#1 Runoff potential	Adsorption coefficient (KOC), Field dissipation half-life, Water solubility	USDA model, modified for organophosphates and pyrethroids
#2 Aquatic persistence	HL's in water and sediment	Critical values of 30 and 100 days of half-lives
#3 Aquatic toxicity	Acute toxicity (LC50) for sensitive species	In water: USEPA criteriaIn sediment: DPR criteria
#4 Use pattern	Use pattern	High-exposure patterns identified by DPR scientists
#5 Risk quotient	Label rate, use pattern, KOC, aerobic soil metabolism half-life (AERO), LC50	USEPA PRZM, simplifiedUSEPA Tier I Rice Model

Indicator #4: use pattern

- Pesticide use patterns with high exposure potentials to surface water:
 - Aquatic and rice pesticides
 - Urban/residential uses
 - Crops with gravity irrigation (DWR irrigation survey)
 - Crops with top acreages in California (PUR database and DWR land use survey)
 - Winter rain season application
 - Pre-emergent application

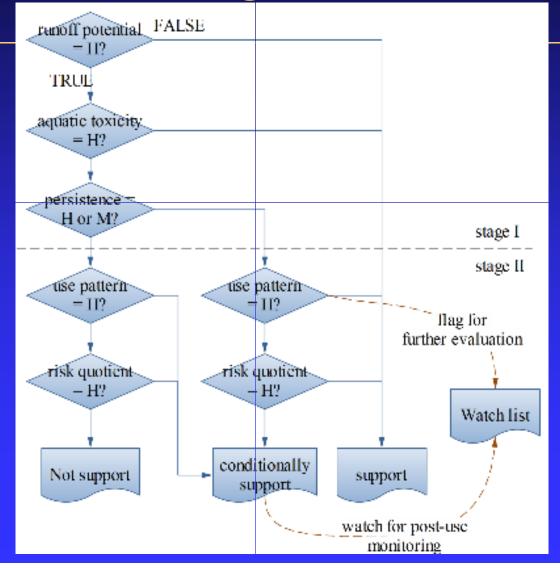

Indicator #5: risk quotient (RQ)

- For high-exposure use pattern only
- RQ = EEC (estimated environmental concentration)/LC50; then compared to the LOC (level of concern) of 0.5
- EEC = f(label rate, chemical properties)
 - Rice pesticides: USEPA Tier 1 Rice Model
 - USEPA tier 2 modeling scenarios: "use-exposure relationships" based on USEPA PRZM
 - Other high-exposure use patterns not supported by regulatory models/scenarios: RQ is set as "High"

Decision-making flowchart

Decisions

- Registration recommendations (for a product)
 - Support registration without conditions
 - Support registration and request analytical methods
 - Do not support registration
- The watch list (for an A.I.)
 - Request analytical methods for the A.I. and watch it as a candidate for post-use monitoring
 - Flag the A.I. for further evaluation if a new label is associated with high-exposure use pattern

Notes

- Dissolved and sediment-bound pesticides
 - Indicators are defined for both phases
 - Dissolved phase is always evaluated, while adsorbedphase evaluation is only for pesticides with KOC>1000 (USEPA, 2007, Data requirements for pesticide registration)
 - (for test run only) if no data, LC50_sed (μg/kg[OC]) = LC50_wat (μg/L)*KOC
- Product with multiple use patterns
 - All labeled use patterns are evaluated
 - Professional judgment is required for final decisions

Test run

- 21 new A.I.'s based on evaluations 2008-2010
- To compare decisions for pesticides in dissolved phase
- Criteria for methodology evaluation: comparable/equivalent decisions

Model-based decisions	Professional judgment based decisions		
Dissolved phase			
Support registration	Support registration		
Support registration	Support conditional registration (sediment toxicity test)		
Support conditional registration	Support conditional registration (runoff test)		

Demonstration

- •[W]= place into the watch-list
- •[S]= Support registration
- •[C]= Support conditional registration
- •[N]= Not support registration

A.I.	Product	Model-based decisions	Professional judgment	
		Dissolved	Adsorbed	based decisions
Α	A1	[S]	[S]	[S]
B [W]	B1	[C]	-	[S]
	B2	[C]	-	
	B3	[C]	-	
С	C1	[S]	[N]	[C] (sed. tox & runoff)
D	D1	[S]	-	[S]
E	E1	[S]	-	[S]
F	F1	[S]	[S]	[S]
G [W]	G1	[C]	[C]	[C] (runoff test)
Н	H1	[S]	[S]	[C] (sed. tox)
	H2	[S]	[S]	
	H3	[S]	[S]	

A.I.	Product (EPA Reg #)	Model-based decisions	Professional judgment	
		Dissolved	Adsorbed	based decisions
1	I1	[S]	[S]	[S]
J	J1	[S]	[S]	[C] (sed. tox)
	J2	[S]	[S]	
K	K1	[S]	-	[S]
L	L1	[S]	-	[S]
M	M1	[S]	-	[S]
N [W]	N1	[C]	-	[C] (runoff)
0	Q1	[S]	-	[S]
Р	P1	[S]	[S]	[S]
Q [W]	Q1	[C]	-	[C] (runoff)
	Q2	[S]	-	
R	R1	[S]	[S]	[N]
S	S1	[S]	[S]	[S]
Т	T1	[S]	[S]	[S]
U	U1	[S]	-	[S]

Summary

- Two-stage process
 - Active ingredient
 - Product
- Interpretation of evaluation results
 - Registration recommendations
 - The watch list of A.I.'s
- Model robustness and improvements
 - Development of indicators
 - Decision-making processes
